# Function to allocate memory for a 2-D array of type double, Usage in HW-7

```
double** allocArrayDouble(double **a, int M, int N) {  
    int i;  
    /* allocate storage for an array of pointers */  
    a = malloc(M * sizeof(double *));  
  
    /* for each pointer, allocate storage for an array  
     * of double */  
    for (i = 0; i < M; i++) {  
        a[i] = malloc(N * sizeof(double));  
    }  
  
    return a;  
}
```

# Homework 7 Solution (1)

```
1. #include <stdio.h>
2. #include <stdlib.h>

3. void printMatrix(double **arrayA, int M, int N);
4. void matmul(double **matA, double **matB);
5. double** allocArrayDouble(double **a, int M, int N);

6. int main(){
7.     int Rows, Cols;
8.     int i, j, count;
9.     double **myMatrixA, **myMatrixB;

10.    Rows = 2;
11.    Cols = 2;
```

# Homework 7 Solution (2)

```
12. myMatrixA = allocArrayDouble(myMatrixA, Rows, Cols);  
13. myMatrixB = allocArrayDouble(myMatrixB, Rows, Cols);  
14. count = 1;  
15. for (i=0; i<Rows; i++) {  
16.     for (j=0; j<Cols; j++) {  
17.         myMatrixA[i][j] = count;  
18.         myMatrixB[i][j] = count;  
19.         count++;  
20.     }  
21. }  
22. matmul (myMatrixA, myMatrixB);  
23. free (myMatrixA);  
24. free (myMatrixB);  
25. return 0;  
26. }
```

# Homework 7 Solution (3)

```
27. void matmul(double **matA, double **matB) {  
28.     int i,j,k,sum;  
29.     int Rows = 2;  
30.     int Cols = 2;  
31.     double **myMatrixC =  
            allocArrayDouble(myMatrixC,Rows,Cols);  
27.     //perform matrix multiply  
28.     for (i = 0; i < Rows; i++) {  
29.         for (j = 0; j < Cols; j++) {  
30.             sum = 0;  
31.             for (k = 0; k < Cols; k++) {  
32.                 sum += matA[i][k] * matB[k][j];  
33.             }  
34.             myMatrixC[i][j] = sum;  
35.         }  
36.     }
```

# Homework 7 Solution (4)

```
37.     printMatrix(myMatrixC, Rows, Cols);  
38.     free(myMatrixC);  
39. }  
40. void printMatrix(double **arrayA, int M, int N){  
41.     int i,j;  
42.     printf("Matrix C is:\n");  
  
43.     for (i = 0; i < M; i++) {  
44.         for (j = 0; j < N; j++) {  
45.             printf(" %lf ",arrayA[i][j]);  
46.         }  
47.         printf("\n");  
48.     }  
49.     printf("\n");  
50. }
```

# Homework 7 Solution (5)

```
51. double** allocArrayDouble(double **a, int M, int N) {  
52.     int i;  
53.     a = malloc(M* sizeof(double *));  
54.     for (i = 0; i < M; i++) {  
55.         a[i] = malloc(N * sizeof(double));  
56.     }  
57.     return a;  
58. }
```

# Overview of the Course

- Writing a Basic C Program
- Understanding Errors
- Comments Keywords, Identifiers, Variables
- Operators
- Standard Input and Output (Basic)
- Control Structures
- Standard Input and Output
- Arrays, Structures
- Functions in C
- Pointers
- Working with Files

All the concepts will be accompanied with examples.

# Including Library File for Maths: mathExample.c

```
#include <stdio.h>
#include <math.h>
int main() {
    double myNum = 2.2;
    int times = 8 ;
    printf("Square root of %lf is: %lf\n",myNum, sqrt(myNum) );
    return 0;
}
```

Output:

Square root of 2.200000 is: 1.483240

# Math Library on Ranger (MinGW users can ignore this)

- Note that `math.h` is a header-file that just includes the declarations of the math functions – recall function prototypes
- The compiled definitions are in the math library
- Link your program to the math library by adding `-lm` to the `gcc` command

```
login3$ gcc -o mathExample mathExample.c
/tmp/ccOdwtYH.o: In function `main':
mathExample.c:(.text+0x2b): undefined reference to `sqrt'
mathExample.c:(.text+0x74): undefined reference to `pow'
collect2: ld returned 1 exit status
login3$ gcc -o mathExample mathExample.c -lm
login3$
```

# User-Defined Header Files

- Useful in multi-module, multi-person software development effort
- Save the following code in a file named head.h and don't compile/run it

```
/* This is my little header file named head.h */  
#define HAPPY 100  
#define SPIT printf  
#define POOL {  
#define PEEL }
```

# User-Defined Header Files

- This is how the file head.h can be included in any program, here headTest.c

```
#include <stdio.h>
#include "head.h" ← Notice the quotes around file name
int main()
POOL
SPIT("This guy is happy: %d percent\n", HAPPY);
return(0);
PEEL
```

Output:

This guy is happy: 100 percent

# File I/O

- File pointer is required for accessing files to read, write or append

```
FILE *fp;
```

- **fopen** function is used to open a file and it returns a file pointer

```
FILE *fopen(const char *filename, const char *mode);
```

- The modes in which a file can be opened

r - open **for reading**

w - open **for writing** (file need not exist)

a - open **for appending** (file need not exist)

r+ - open **for reading and writing**, start at beginning

w+ - open **for reading and writing** (overwrite file)

a+ - open **for reading and writing** (append **if** file exists)

- To close a file

```
int fclose(FILE *a_file);
```

P.S. details at <http://www.cplusplus.com/reference/clibrary/cstdio/fopen/>

# File I/O: fileExample.c

```
#include <stdio.h>
#include <stdlib.h>
int main() {
    int i, myInt;
    FILE *ifp;
    char *mode = "r";
    ifp = fopen("in.txt", mode);
    if (ifp == NULL) {
        fprintf(stderr, "Can't open input file in.txt!\n");
        exit(1);
    }else{
        for (i=0; i<10; i++){
            fscanf(ifp,"%d", &myInt); <--- fscanf is used for reading file
            printf("%d\n",myInt);           contents
        }
    }
    fclose(ifp);
    return 0;
}
```

# Write to a File: writeToFile.c

```
#include <stdio.h>
int main() {
    FILE *fp;
    fp = fopen("in2.txt","a+");
    fprintf(fp,"%d",7000); <--- fprintf is used for
    fclose(fp);                      writing data to a file
    return 0;
}
```

---- Opening the file in  
append mode

↓

---- **fprintf** is used for  
writing data to a file

# Homework 8

- Redo the matrix multiplication problem assigned in the previous homeworks using file I/O
- Instead of hard-coding the initial values of matrices, read them from a file
- Instead of printing the product of the two matrices on the screen, print it to the file
